

HELLENIC ASSOCIATION OF PHOTOVOLTAIC COMPANIES

Greek PV Market statistics - 2020

Update: May 18th, 2021

In 2020, a new legislation gave the right to PV developers to secure a higher reference value (tariff) for the energy fed into the grid, based on a declaration of “readiness for connection” and not on the actual connection date. As a result, there was a boom in installations before year end. Almost half of this installed capacity though will be connected to the grid in 2021. That is why we give both figures (installed and connected) for annual and cumulative capacity.

Installed and Connected capacity	MWp
New installed capacity in 2020	913
New connected capacity in 2020	459
Cumulative installed capacity	3,742
Cumulative connected capacity	3,288
